The golden ratio can be written exactly using a square root.
$\frac{1+\sqrt{5}}{2}=1.6180339887 \ldots$

The spreadsheet shows that when you find the ratio of any two successive terms in the Fibonacci sequence (divide the larger by the smaller), you approach the limit of 1.6180339887 . ... This is called the golden ratio.

In art, a rectangle whose side lengths are in this ratio is considered aesthetically pleasing. Identify some uses of this "golden rectangle" in art and architecture.

## SOLUTION

The dimensions of the front of the Parthenon in Athens are roughly that of a golden rectangle.

## EXAMPLE 4 Using the Golden Ratio

 sequence (divide the larger by the smaller), you號
## $\sqrt{\text { Checkpoint }}$
