

# Chapter 9 Summary

## Section Objectives

## How does it apply to you?

Section 1	Use stacked area graphs to represent the changing parts of a whole.		You can see how related variables graphically change over time. <i>(See Examples 1 and 2.)</i>
	Use a radar graph and an area graph to represent data.		There are many creative and unique ways to help people understand and use information. <i>(See Examples 3 and 4.)</i>
	Graphically represent data sets that have several variables.		Not all information is represented with simple types of information design, such as bar graphs, circle graphs, and scatter plots. <i>(See Examples 5 and 6.)</i>
Section 2	Use mean, median, and mode to describe the average value of a data set.		Measures of central tendency are used to compare and communicate data in real life. <i>(See Examples 1 and 2.)</i>
	Read and understand box-and-whisker plots and histograms.		You can use box-and-whisker plots and histograms to analyze the variability and distribution of data sets. <i>(See Examples 3 and 4.)</i>
	Understand the effect of outliers on averages.		Outliers can significantly change measures of central tendency. This could lead to using bad information for decision making. <i>(See Examples 5 and 6.)</i>
Section 3	Use standard deviation to describe the dispersion of a data set.		Standard deviation allows you to determine whether data values are clustered around the mean or spread out over a large range. <i>(See Examples 1 and 2.)</i>
	Use standard deviation to describe a data set that is normally distributed.		Many naturally occurring data sets have a normal distribution. You can use standard deviation to determine whether a data set is normal. <i>(See Examples 3 and 4.)</i>
	Compare different types of distributions.		Not all data distributions are normal. There are other types of distributions. <i>(See Examples 5 and 6.)</i>
Section 4	Use a randomly chosen sample to describe a population.		If a sample is randomly taken from a population, then you can use the sample mean to estimate the population mean. <i>(See Examples 1 and 2.)</i>
	Determine whether a sample is representative of a population.		If your sample is too small, not random, or biased, the statistics from the sample will not represent the population. <i>(See Examples 3 and 4.)</i>
	Determine a sample size to obtain valid inferences.		The minimum sample size depends on the confidence level and the margin of error chosen. <i>(See Examples 5 and 6.)</i>
